

Project - 5 (DATASET: Online Retail) The transactions

made by a UK-based, registered, non-store online retailer between December 1, 2010, and December 9, 2011, are all included in the transnational data set known as online retail. The company primarily offers one-of-a-kind gifts for every occasion. The company has a large number of wholesalers as clients. Company Objective Using the global online retail dataset, we will design a clustering model and select the ideal group of clients for the business to target.

1 data. In the above dataset we will take customer id and quantity based on that we make the clusters. When the K-value is low error rate is more and the K-value is high error rate is very high. So, finally we can conclude the above dataset is best fit for K-Means.
